Dear Texas Railroad Commission,

After last winter's storms, the Texas legislature required the Railroad Commission and the PUC to assure that the gas wells, pipelines and generating plants were winterized so that we don't face another big blackout. A recent FERC investigation noted that gas fuel supply issues were the second largest cause of outages, other than electric generator freezing issues. It's critical that all the gas wells, pipelines, and parts of the gas supply chain are prepared to operate in winter storms.

This is serious. Hundreds of people died as a result of power outages in February, and the disaster cost Texans hundreds of billions of dollars in damages. We are counting on the railroad commission to provide strong rules and strict oversight to make sure this doesn't happen again.

One of the key failures identified after the storm was that the gas compressors had failed to identify themselves as critical infrastructure that should not be turned off in a rolling blackout by the electric utilities that serve them. The RRCs current proposed rule language allows any operator to opt-out of "critical infrastructure" designation. Any operator that opts out will not be required to weatherize. I want to see all operators that supply gas to electric generation facilities classified as critical infrastructure.

The proposed rule also only applies to gas facilities that receive power from the grid. Many gas wells are not connected to the grid but are still an important part of the fuel supply chain. All gas facilities that supply electric generators need to be weatherized.

Sincerely,
Wayne Stalsworth

Dear Texas Railroad Commission,

I'm 80 years old and I was collecting snow and ice cycles last February to melt to flush the toilet and that has made me a little bitter. I have to winterize my pipes and my electric providers CERTAINLY should have to winterize the pipes and gas wells. They are essential infrastructure and must do this. Gas producers must do this. You must make sure they do this- it's your job. ALL GAS FACILITIES THAT SUPPLY ELECTRIC GENERATORS MUST PROPERLY WINTERIZE.

After last winter's storms, the Texas legislature required the Railroad Commission and the PUC to assure that the gas wells, pipelines and generating plants were winterized so that we don't face another big blackout. A recent FERC investigation noted that gas fuel supply issues were the second largest cause of outages, other than electric generator freezing issues. As a 74 year-old Texan, my health depends upon having a warm home in winter and a cool home in summer. I have solar power on my roof and conserve energy whenever possible. Now do your job and require the gas industry to do their job to provide natural gas during extreme weather conditions. Given climate change due to the burning of fossil fuels, cold and hot weather are only going to get worse. You must work for ordinary Texans, not the oil and gas industry.

Sincerely,
Linda Hanratty

Dear Texas Railroad Commission,

We are not fooled by the deregulation bul [REDACTED]. Your job is to protect lives, not just make money for corporate p [REDACTED]!!!

After last winter's storms, the Texas legislature required the Railroad Commission and the PUC to assure that the gas wells, pipelines and generating plants were winterized so that we don't face another big blackout. A recent FERC investigation noted that gas fuel supply issues were the second largest cause of outages, other than electric generator freezing issues. It's critical that all the gas wells, pipelines, and parts of the gas supply chain are prepared to operate in winter storms.

This is serious. Hundreds of people died as a result of power outages in February, and the disaster cost Texans hundreds of billions of dollars in damages. We are counting on the railroad commission to provide strong rules and strict oversight to make sure this doesn't happen again.

One of the key failures identified after the storm was that the gas compressors had failed to identify themselves as critical infrastructure that should not be turned off in a rolling blackout by the electric utilities that serve them. The RRCs current proposed rule language allows any operator to opt-out of "critical infrastructure" designation. Any operator that opts out will not be required to weatherize. I want to see all operators that supply gas to electric generation facilities classified as critical infrastructure.

The proposed rule also only applies to gas facilities that receive power from the grid. Many gas wells are not connected to the grid but are still an important part of the fuel supply chain. All gas facilities that supply electric generators need to be weatherized.

Sincerely,
Christy Townsend Christy Townsend

Dear Rules Coordinator,

The Railroad Commission's current proposed rule language allows any gas operator to opt-out of "critical infrastructure" designation. This creates an easily exploitable loophole that risks repeating another catastrophic failure of our grid and energy supplies. I urge you to require ALL gas operators to weatherize their equipment.

After last winter's storms, the Texas legislature required the Railroad Commission and the PUC to assure that the gas wells, pipelines, and generating plants were winterized so that we don't face another big blackout. A recent FERC investigation noted that gas fuel supply issues were the second largest cause of outages, other than electric generator freezing issues. Dear Texas Railroad Commission,

We were without power for 85 hours during Uri. After last winter's storms, the Texas legislature required the Railroad Commission and the PUC to assure that the gas wells, pipelines and generating plants were winterized so that we don't face another big blackout. A recent FERC investigation noted that gas fuel supply issues were the second largest cause of outages, other than electric generator freezing issues. It's critical that all the gas wells, pipelines, and parts of the gas supply chain are prepared to operate in winter storms.

This is serious. Hundreds of people died as a result of power outages in February, and the disaster cost Texans hundreds of billions of dollars in damages. We are counting on the railroad commission to provide strong rules and strict oversight to make sure this doesn't happen again.

One of the key failures identified after the storm was that the gas compressors had failed to identify themselves as critical infrastructure that should not be turned off in a rolling blackout by the electric utilities that serve them. The RRCs current proposed rule language allows any operator to opt-out of "critical infrastructure" designation. Any operator that opts out will not be required to weatherize. I want to see all operators that supply gas to electric generation facilities classified as critical infrastructure.

The proposed rule also only applies to gas facilities that receive power from the grid. Many gas wells are not connected to the grid but are still an important part of the fuel supply chain. All gas facilities that supply electric generators need to be weatherized.

Sincerely,
David Todd
